

PV Labs | Matchday Analysis | K-League 1

Mar 05 - Mar 08

Why We Model

This isn't just about finding a price gap; it's about the search for underlying truth in a sport that is increasingly difficult to quantify. At PV Labs, we spend our weeks neck-deep in net xGOT and progression metrics because we believe the data tells a story that the naked eye often misses.

The PV10 Algorithm is our proprietary lens. It filters every match through four core pillars: Finishing, Creation, Progression, and Defence. We benchmark every match against 36 months of historical data and back-test each round to keep league-specific weights robust.

High-Variance Fixture

K-League 1 | FC Anyang vs Jeju United FC

- PV Model (DNB AH 0.0): 1.91 (Home) | Market Price: 1.83
- Market Divergence: +5.24%

The Deep Dive: Team-level xGOT snapshot is limited for this fixture, so we treat this as a pure price-separation signal.

Convergence Fixture

K-League 1 | Sangju Sangmu FC vs Jeonbuk Hyundai Motors

- PV Model (DNB AH 0.0): 1.94 (Away) | Market Price: 1.79
- Market Divergence: +1.46% (Convergence)

The Deep Dive: Price is close to fair, so this fixture serves as a calibration check rather than a conviction play.

Institutional Benchmark

K-League 1 | Daejeon Citizen is this week's benchmark: net xGOT -1.00, efficiency ratio n/a, prevention ratio 0.86, recent rating 8.47.

The Audit Continues

We will settle these figures on Tuesday, looking not just at the scoreline, but at the underlying performance metrics to see if our pillar weightings held true.
