

PitchValue Labs | Matchday Analysis | K-League

Mar 14 - Mar 17

Why We Model

This isn't just about finding a price gap; it's about the search for underlying truth in a sport that is increasingly difficult to quantify. At PV Labs, we spend our weeks neck-deep in net xGOT and progression metrics because we believe the data tells a story that the naked eye often misses.

The PV10 Algorithm is our proprietary lens. It filters every match through four core pillars: Finishing, Creation, Progression, and Defence. We benchmark every match against 36 months of historical data. We focus on the Asia Pacific region because markets here are less efficient. Our model applies league-specific weights to different metrics because what wins a match in one league doesn't do the same in another. We back-test our model after every round - if results aren't optimal, we explore ways to improve it.

No high-divergence fixture detected in this cycle.

No low-divergence fixture detected in this cycle.

K-League: no clear benchmark team in latest team snapshot.

The Audit Continues

We will settle these figures on Tuesday, looking not just at the scoreline, but at the underlying performance metrics to see if our pillar weightings held true. Join the Desk: If you share our passion for the game within the game, join us for the full experience. Our subscribers get the full metric breakdown, raw back-testing logs, and our daily data-dumps. Here is a link to our most recent Matchday Review Audit: <https://www.pitchvaluelabs.com/hub>.
